Motivation

- A robot wrote this entire article. Are you scared yet, human?

<https://www.theguardian.com/commentisfree/2020/sep/08/robot-wrote-this-article-gpt-3>

- What It's Like To be a Computer: An Interview with GPT-3

https://www.youtube.com/watch?v=PqbB07n_uQ4

Natural Language Processing

- Enabling machines to process, represent, understand, and generate languages

In fact, the Chinese NORP market has the three CARDINAL most influential names of the retail and tech space – Alibaba GPE , Baidu ORG , and Tencent PERSON (collectively touted as BAT ORG), and is betting big in the global AI GPE in retail industry space . The three CARDINAL giants which are claimed to have a cut-throat competition with the U.S. GPE (in terms of resources and capital) are positioning themselves to become the ‘future AI PERSON platforms’. The trio is also expanding in other Asian NORP countries and investing heavily in the U.S. GPE based AI GPE startups to leverage the power of AI GPE . Backed by such powerful initiatives and presence of these conglomerates, the market in APAC AI is forecast to be the fastest-growing one CARDINAL , with an anticipated CAGR PERSON of 45% PERCENT over 2018 - 2024 DATE .

To further elaborate on the geographical trends, North America LOC has procured more than 50% PERCENT of the global share in 2017 DATE and has been leading the regional landscape of AI GPE in the retail market. The U.S. GPE has a significant credit in the regional trends with over 65% PERCENT of investments (including M&As, private equity, and venture capital) in artificial intelligence technology. Additionally, the region is a huge hub for startups in tandem with the presence of tech titans, such as Google ORG , IBM ORG , and Microsoft ORG .

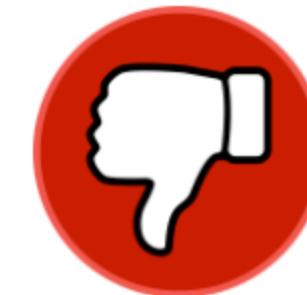

NLP Applications

➤ Text Classification

"I love this movie.
I've seen it many times
and it's still awesome."

"This movie is bad.
I don't like it at all.
It's terrible."

NLP Applications

➤ Machine Translation

The screenshot shows the Google Translate interface. At the top, there are tabs for 'Text' (selected) and 'Documents'. Below that, the source language is set to 'ENGLISH' and the target language is 'GERMAN'. The input text 'I love teaching humans and machines' is on the left, and the translated text 'Ich liebe es, Menschen und Maschinen beizubringen' is on the right. There is a small star icon next to the German translation. At the bottom, there are icons for microphone, speaker, and sharing, along with a progress bar showing '35 / 5000'.

NLP Applications

- Question Answering/Comprehension

Passage Sentence

In meteorology, precipitation is any product of the condensation of atmospheric water vapor that falls under gravity.

Question

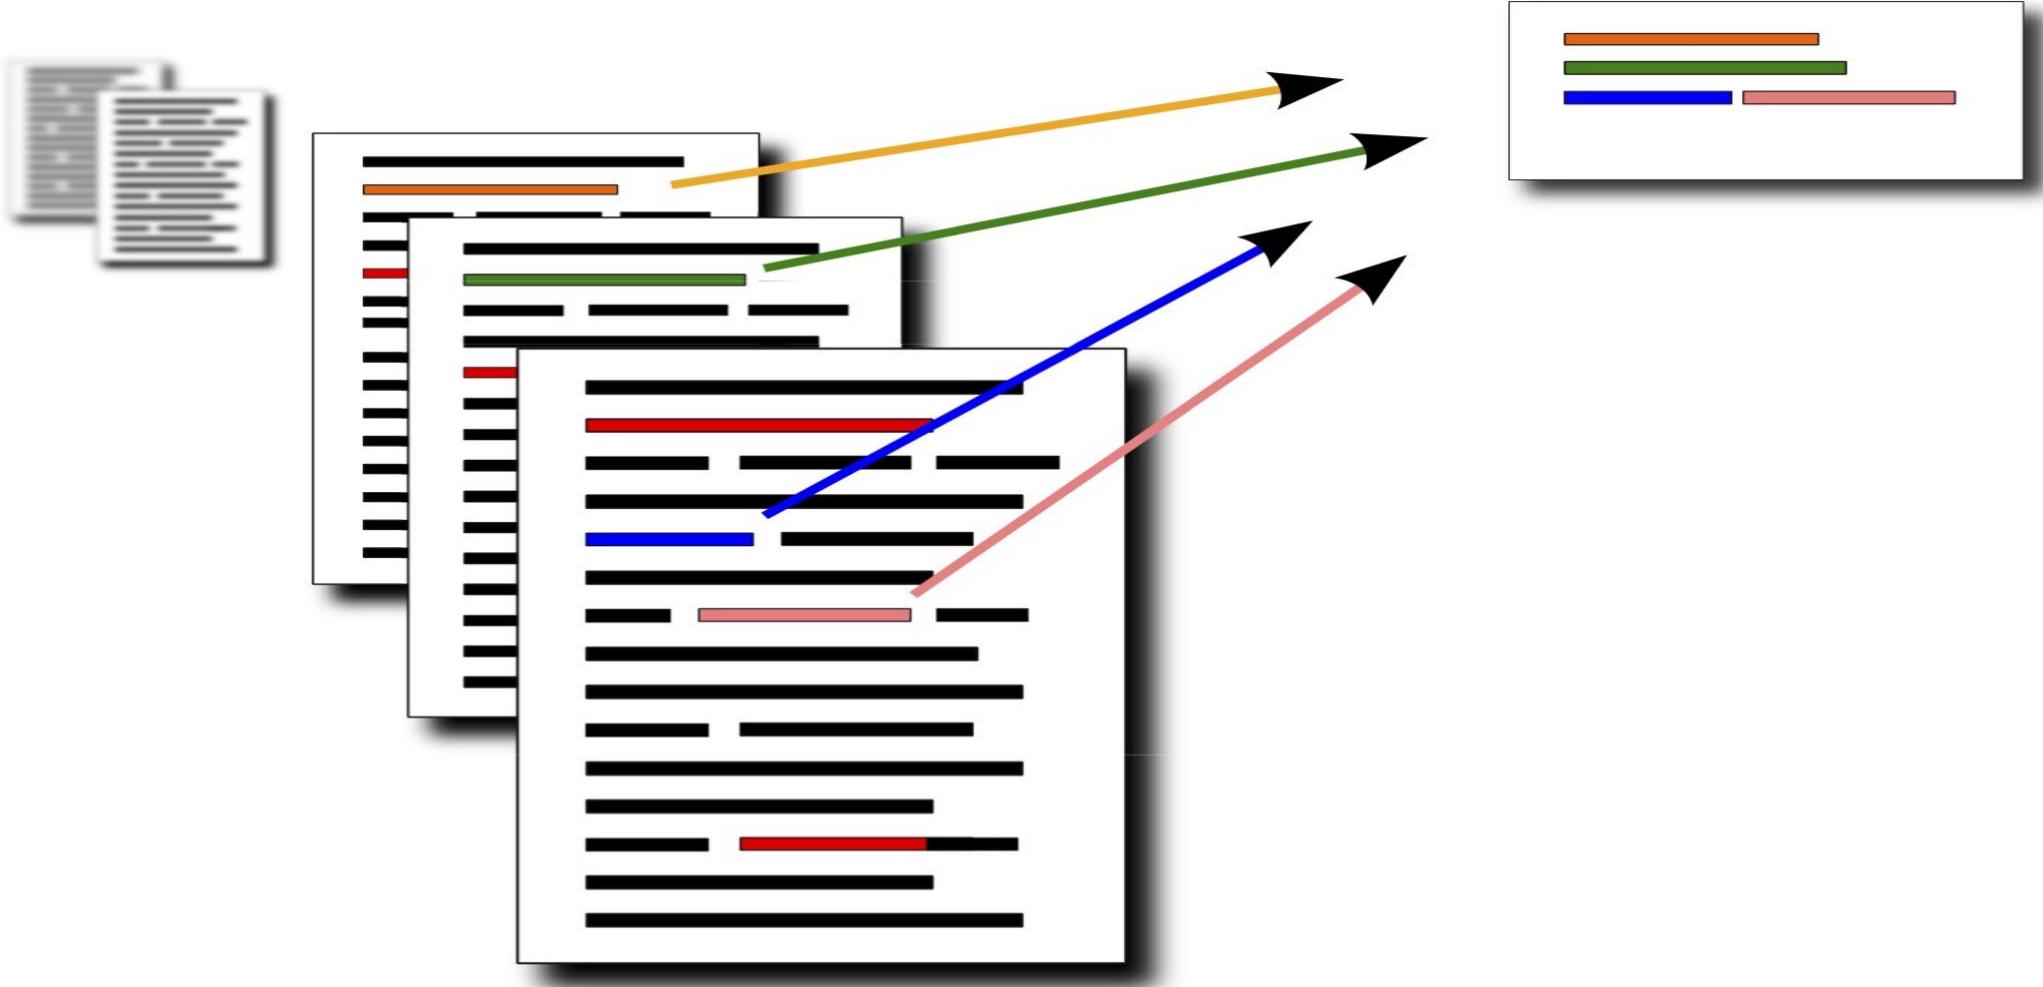

What causes precipitation to fall?

Answer Candidate

gravity

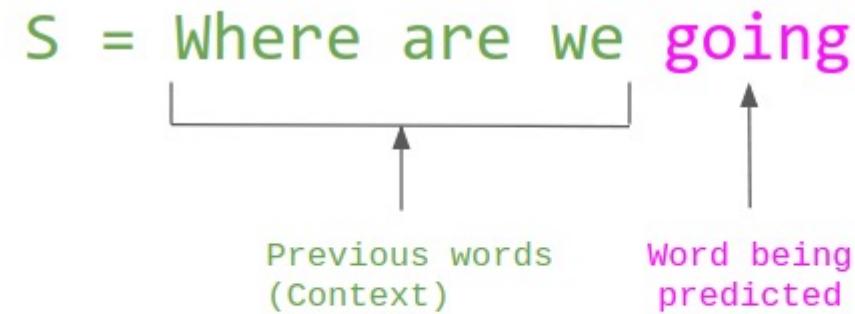

NLP Applications

➤ Text Summarization

Language Modelling

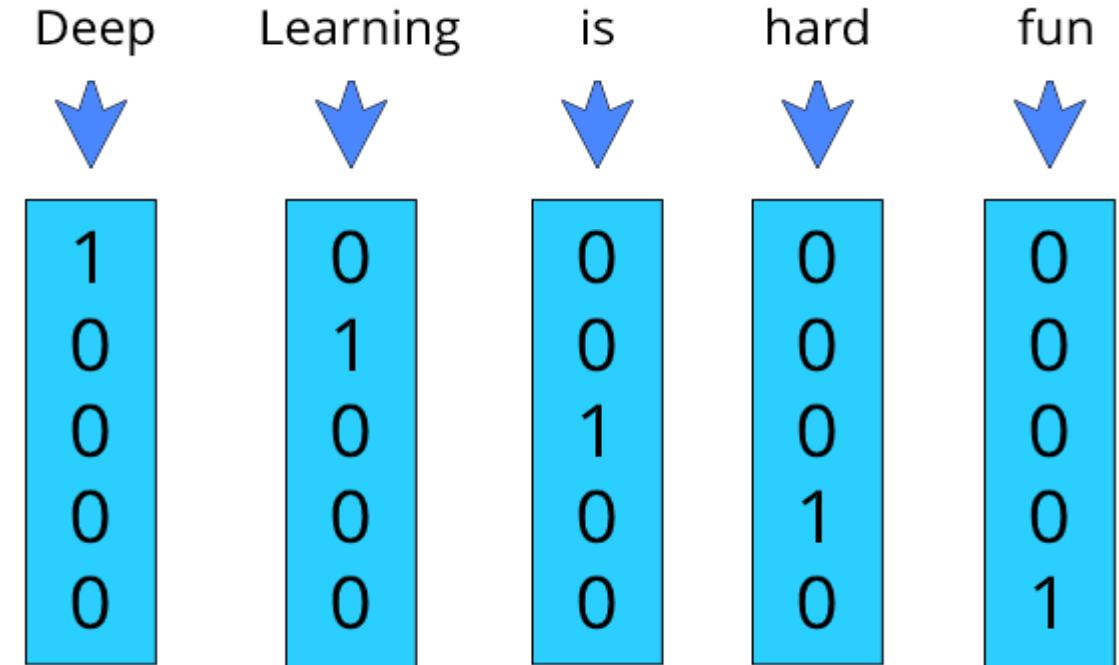

- A probability distribution over words or word sequences
- Probability distribution over strings of text
 - How likely is a string in a given “language”?

$$P(S) = P(\text{Where}) \times P(\text{are} \mid \text{Where}) \times P(\text{we} \mid \text{Where are}) \times P(\text{going} \mid \text{Where are we})$$

Representing text: One-hot Encoding

- One-hot vector of an ID is a vector filled with 0s, except for a 1 at the position associated with the ID.
 - For e.g., for vocabulary size D=10, the one-hot vector of word (w) having ID=4 is
$$e(w) = [0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \ 0]$$
- One-hot encoding makes no assumption about word similarity
 - All words are equally similar/different from each other
- This is a natural representation to start with, though a poor one

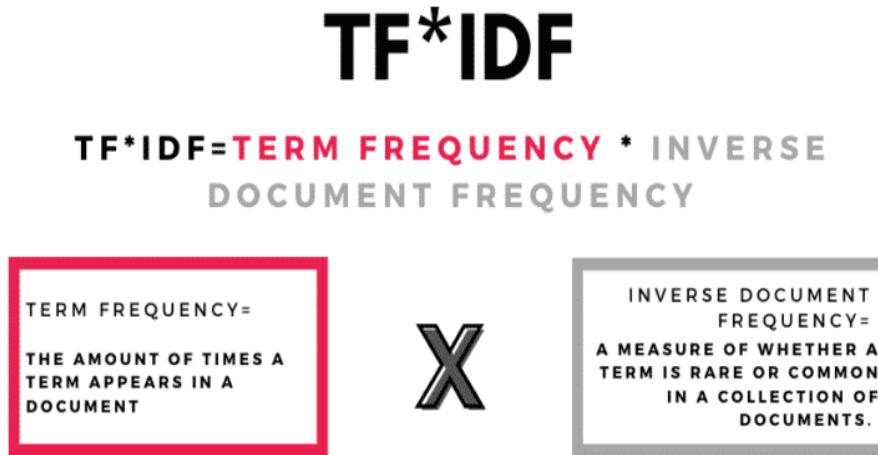

Representing text: Count Vectorizer

- Counts the number of occurrences of each word appearing in a document
- Converts a collection of text documents to a vector of term/token counts

| | the | red | dog | cat | eats | food |
|--------------------|-----|-----|-----|-----|------|------|
| 1. the red dog ➔ | 1 | 1 | 1 | 0 | 0 | 0 |
| 2. cat eats dog ➔ | 0 | 0 | 1 | 1 | 1 | 0 |
| 3. dog eats food ➔ | 0 | 0 | 1 | 0 | 1 | 1 |
| 4. red cat eats ➔ | 0 | 1 | 0 | 1 | 1 | 0 |

Representing text: tf-idf vectorizer

- Stands for Term Frequency – Inverse Document Frequency (tf-idf)
- Common algorithm to transform text into a meaningful representation of numbers

$$w_{i,j} = tf_{i,j} \times \log \frac{N}{df_j}$$

tf-idf score

occurrences of term in document

total documents

documents containing word

Arrows point from the text definitions to their corresponding terms in the formula:

- An arrow points from "tf_{i,j}" to "tf_{i,j}".
- An arrow points from "N" to "# total documents".
- An arrow points from "df_j" to "# documents containing word".

- This cheesecake is really **yummy**. I'm going for another slice.
- The restaurant service was very slow.

Representing text as vectors

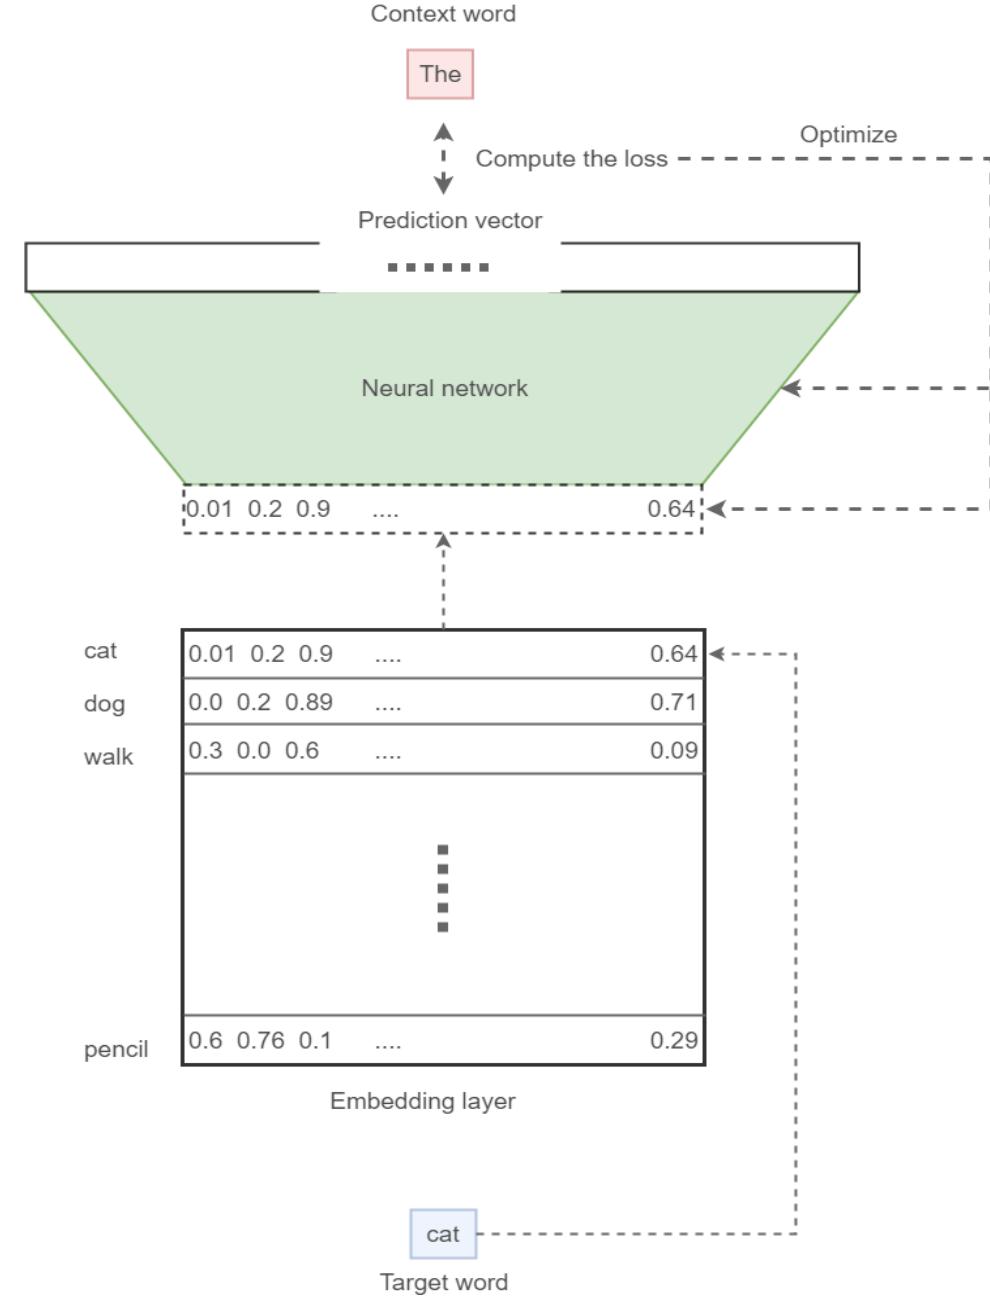

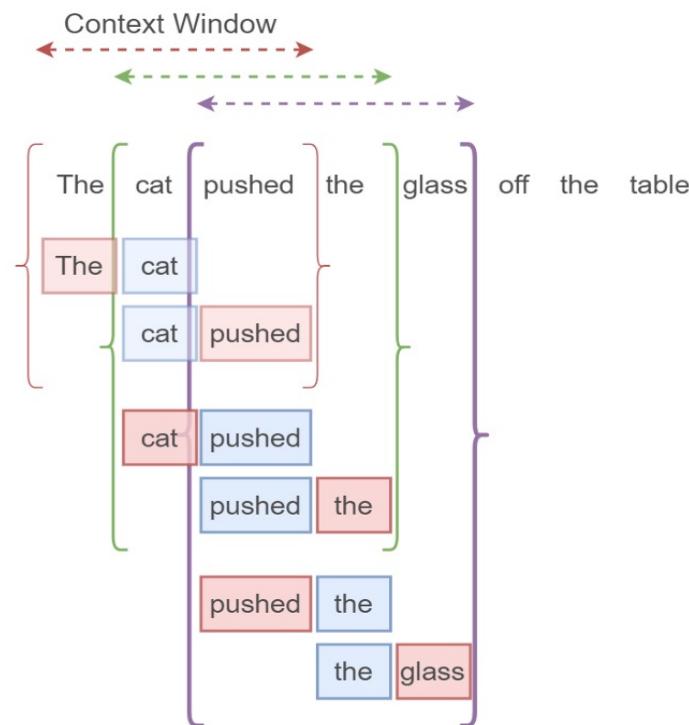

- One-hot encoding, count and tf-idf vectors are **sparse** and **long**
 - Most values are zeros
 - Length of vector is equal to size of vocabulary (can be more than 60,000)
- Alternative is to look for **dense vectors**. These are
 - short and dense
 - easier to use as features in machine learning (less weights to tune)
 - can capture context

Word Embeddings

- Instead of counting how often each word w occurs near “university”, train a classifier on a binary prediction task:
 - Is w likely to show up near “university”?
- We don’t actually care about this task, but we take the learned classifier weights as the word embeddings
- Uses free-form text as implicitly supervised training data
 - A word s near “university” acts as gold standard “ground-truth” to the question
 - No need for hand-labeled supervision
- Word vector algorithms use the context of the words to learn numerical representations for words, so that words used in the same context have similar looking word vectors.

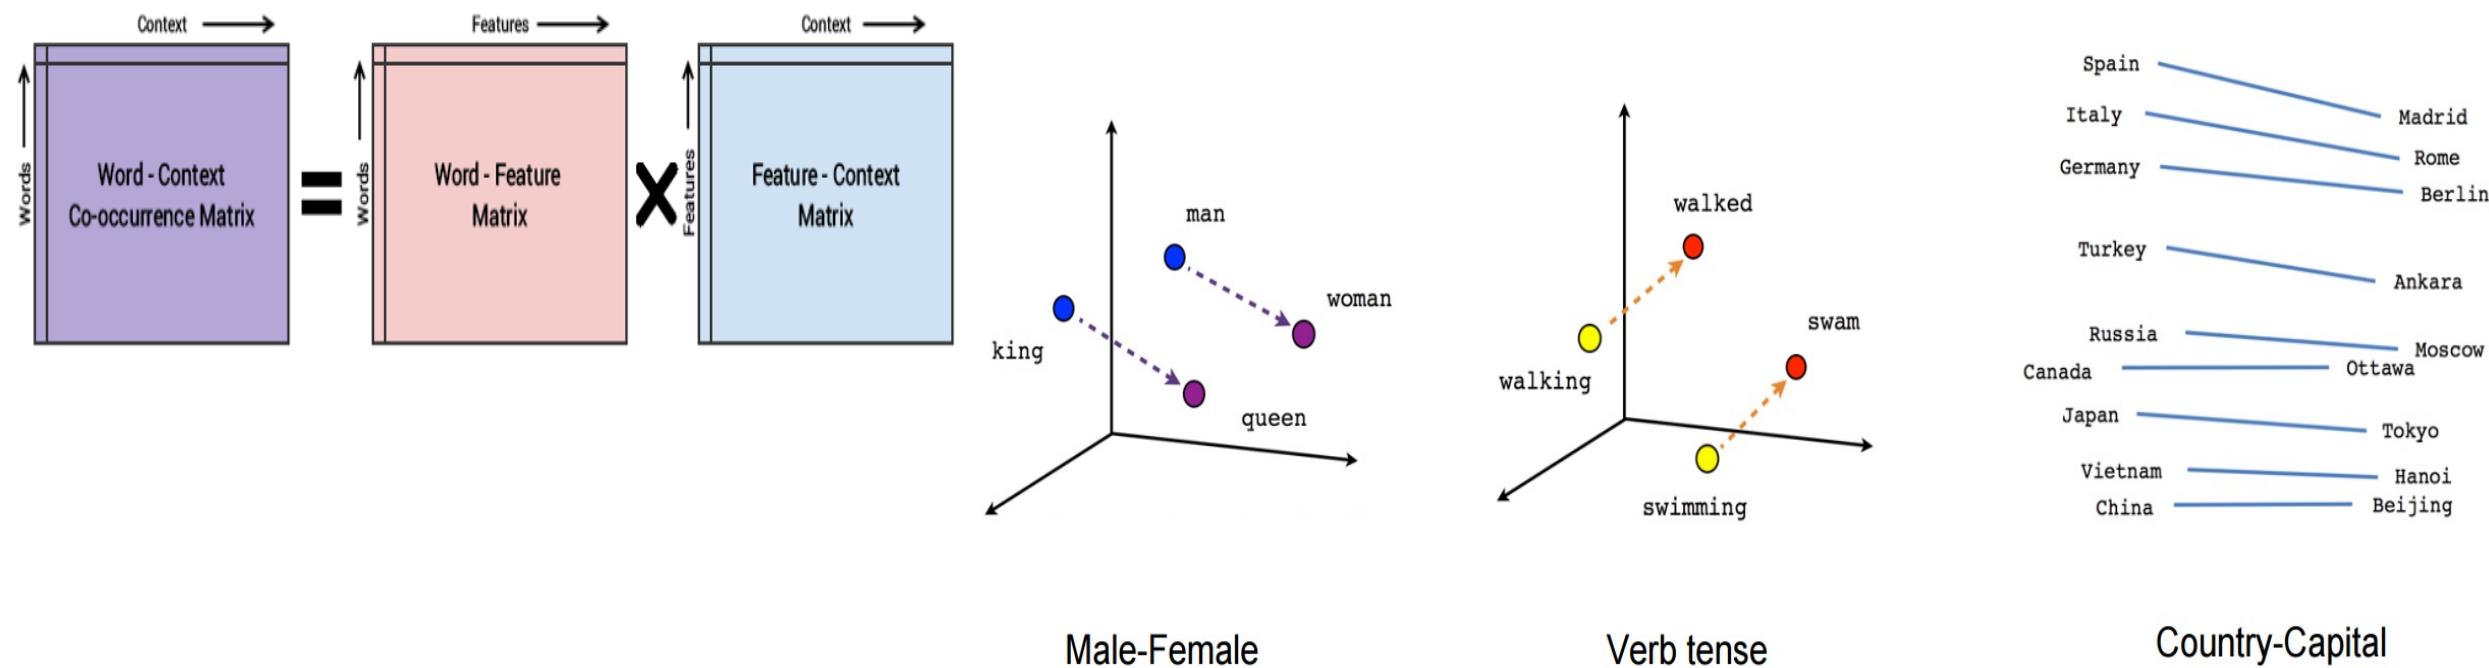

Word2Vec

- “You should know a word by the company it keeps”
– J.R. Firth
- Uses CBOW or Skip-gram model to train the network
- Word2Vec uses skip-gram neural network to predict neighbor context

GloVe

- Word2Vec rely on local statistics (local context information of words)
- GloVe captures both local and global statistics (word co-occurrence) to obtain word vectors
- Can derive semantic relationships between words from the co-occurrence matrix
- Requires upfront pass-through entire dataset

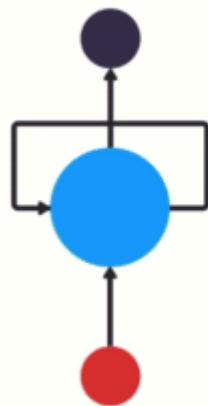

Statistical Language Modeling

- Models that assign probabilities to the sequences of words
- Focus on n-gram
 - 2-gram (bigram). E.g., “going to”, “on the”
 - 3-gram (trigram). E.g., “what are you”, “please turn your”
- Naïve approach:
 - Calculate the probability of word w, given history, h: $P(w|h)$
 - A computation challenge with significant size of corpus
 - Do approximation using chain rule
- Bigram language model
 - Approximates the probability of a word given all the previous words by using the conditional probability of one preceding word
 - Based on Markov assumption: we can predict the probability of some future unit without looking too far in the past
 - Use Maximum Likelihood Estimation (MLE) to estimate the probability function

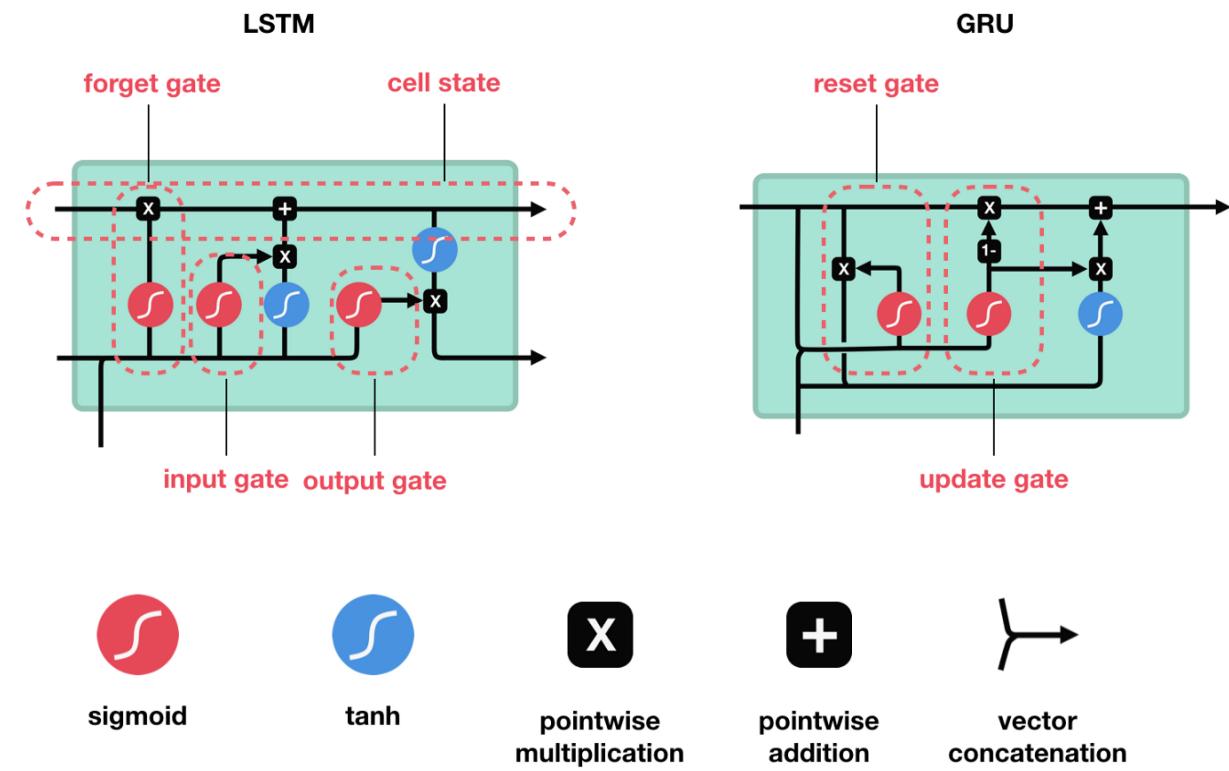

Recurrent Neural Networks (RNNs)

- A class of artificial neural networks suitable for modeling sequential or time-series data
- Exhibit dynamic behavior where connections between nodes form a directed graph along a temporal sequence
- RNNs have a looping mechanism that acts as a highway to allow information to flow from one step to the next. This information is the hidden state, which is a representation of previous inputs.

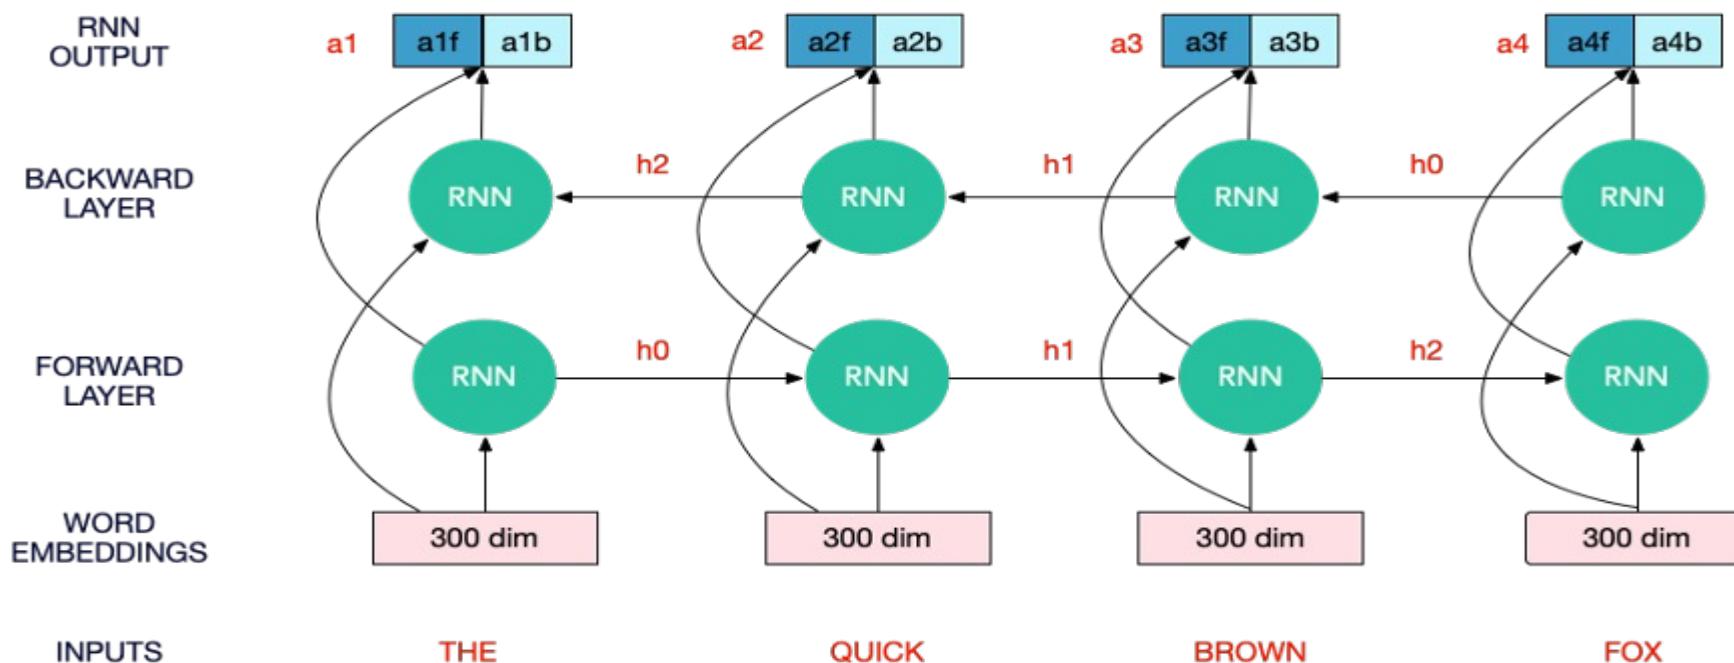

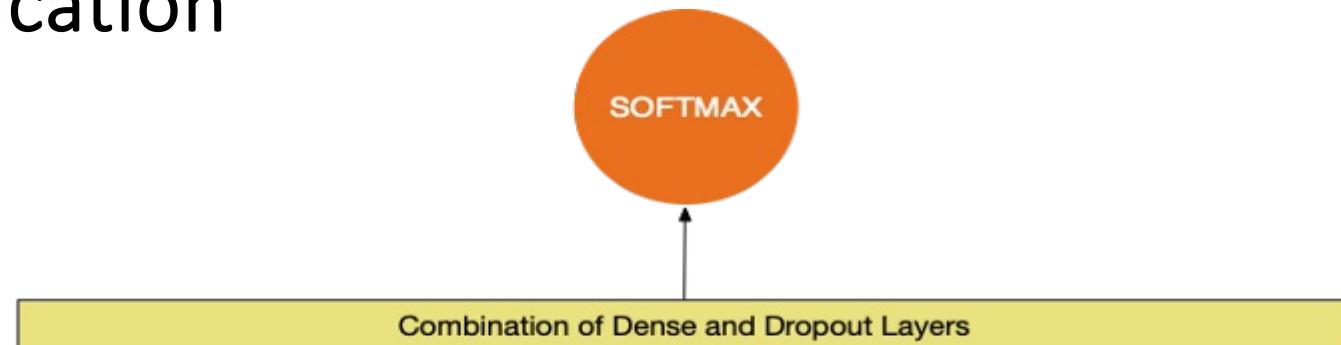

LSTMs/GRUs

- Vanilla RNNs suffers from vanishing gradient problem
 - As the RNNs processes more steps, it has troubles retaining information from previous steps.
 - Due to back-propagation, the earlier layers fail to do any learning as the internal weights are barely being adjusted due to extremely small gradients.
 - Does not learn the long-range dependencies across time steps
- LSTMs and GRUs are two special RNNs, capable of learning long-term dependencies using mechanisms called **gates**.
- These gates are different tensor operations that can learn what information to add or remove to the hidden state.

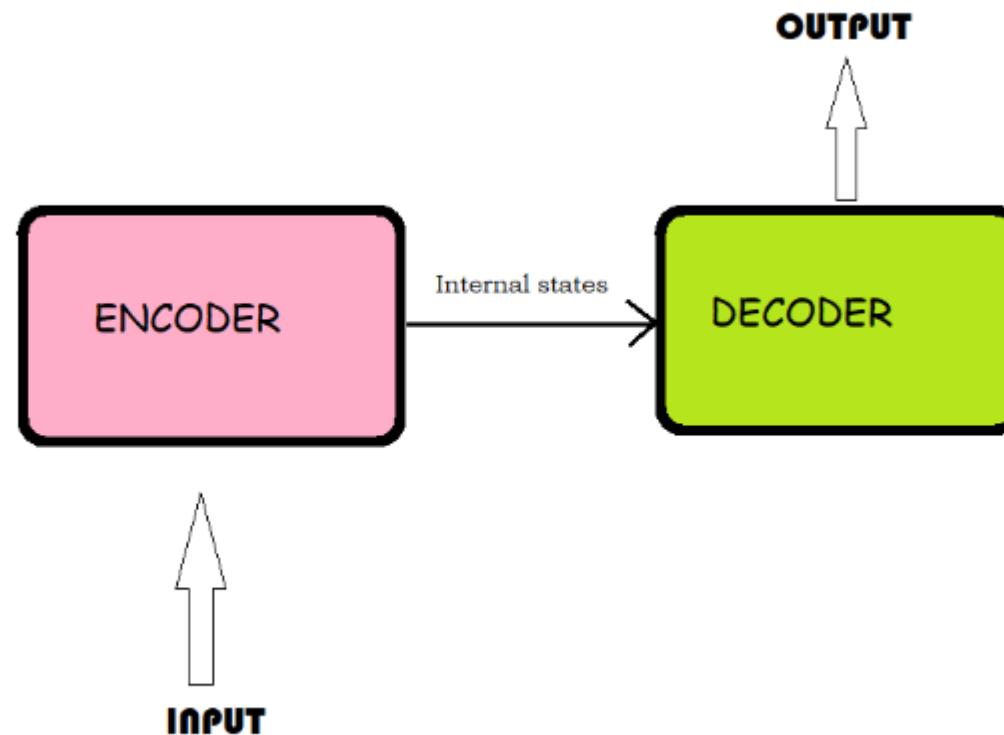

End-to-End text classification

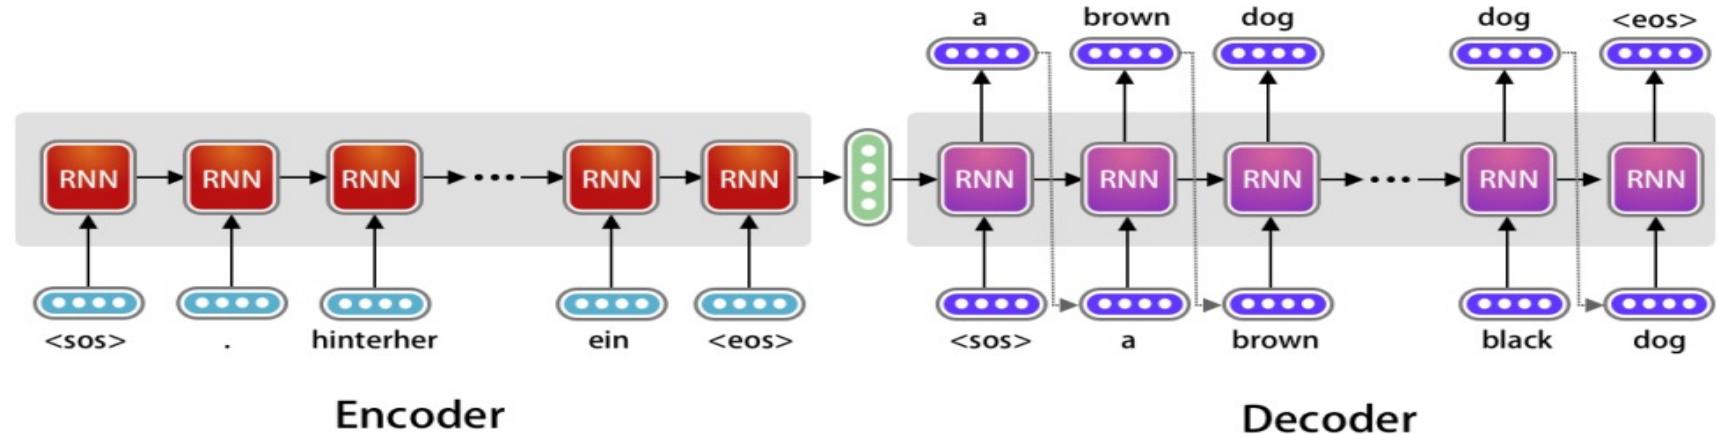

Seq2Seq model

- Model has two parts: Encoder and Decoder (Encoder-Decoder Framework)

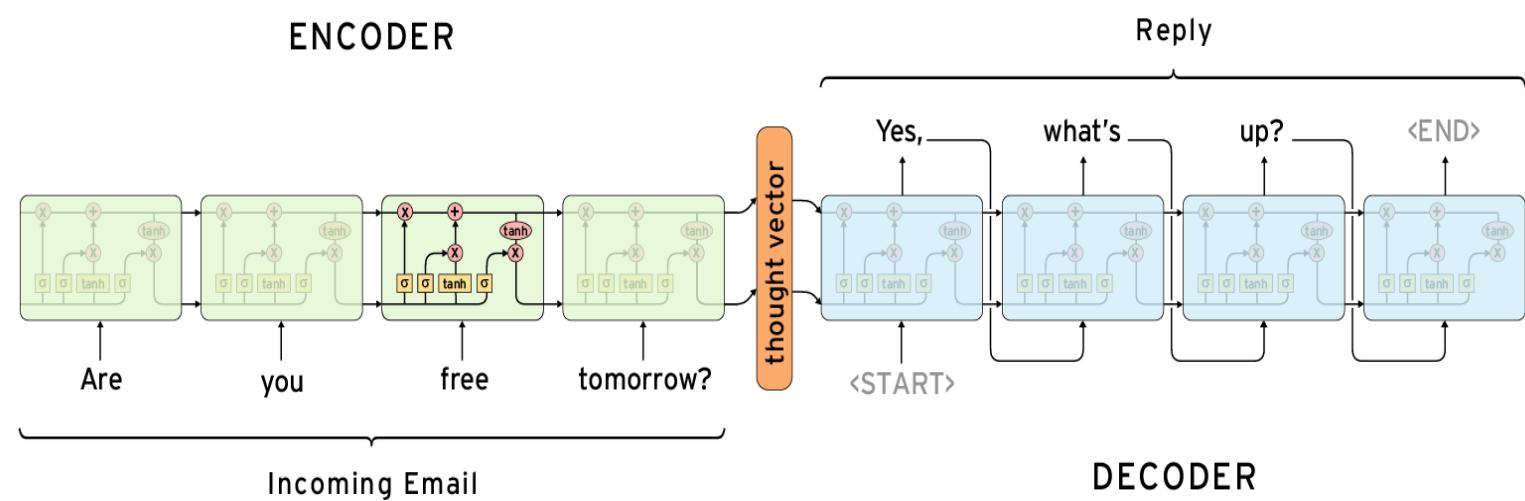

Seq2Seq used for various NLP applications

- Machine Translation

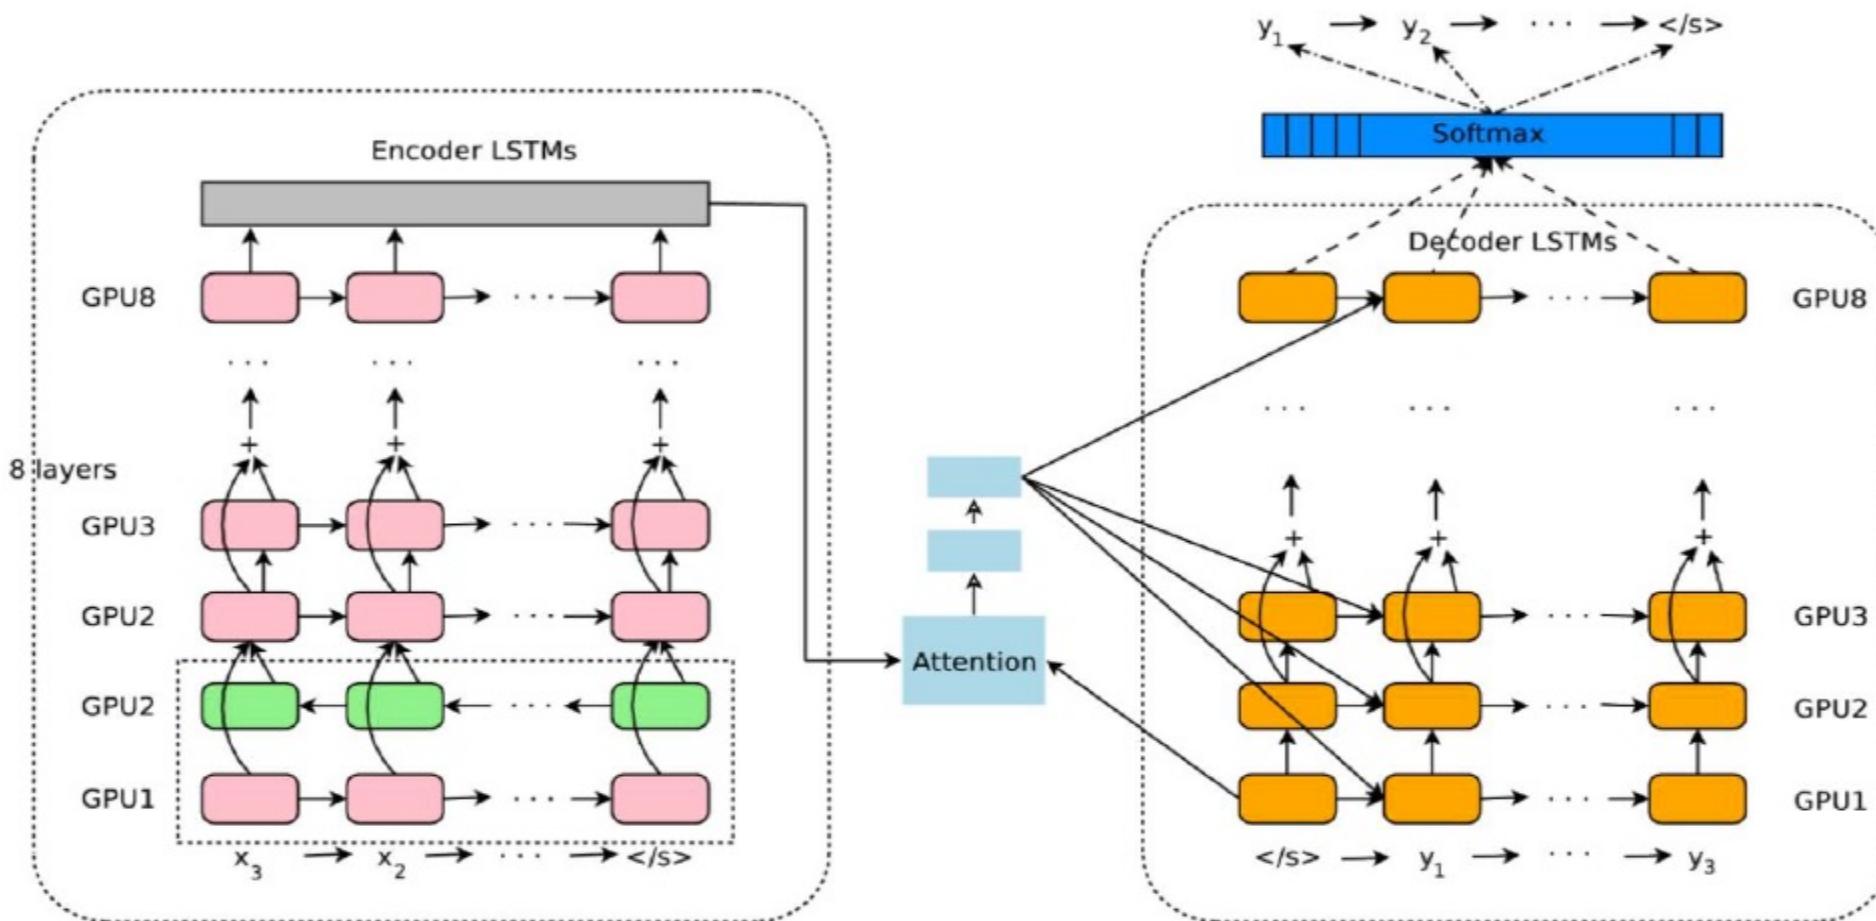

- Automatic Email Reply

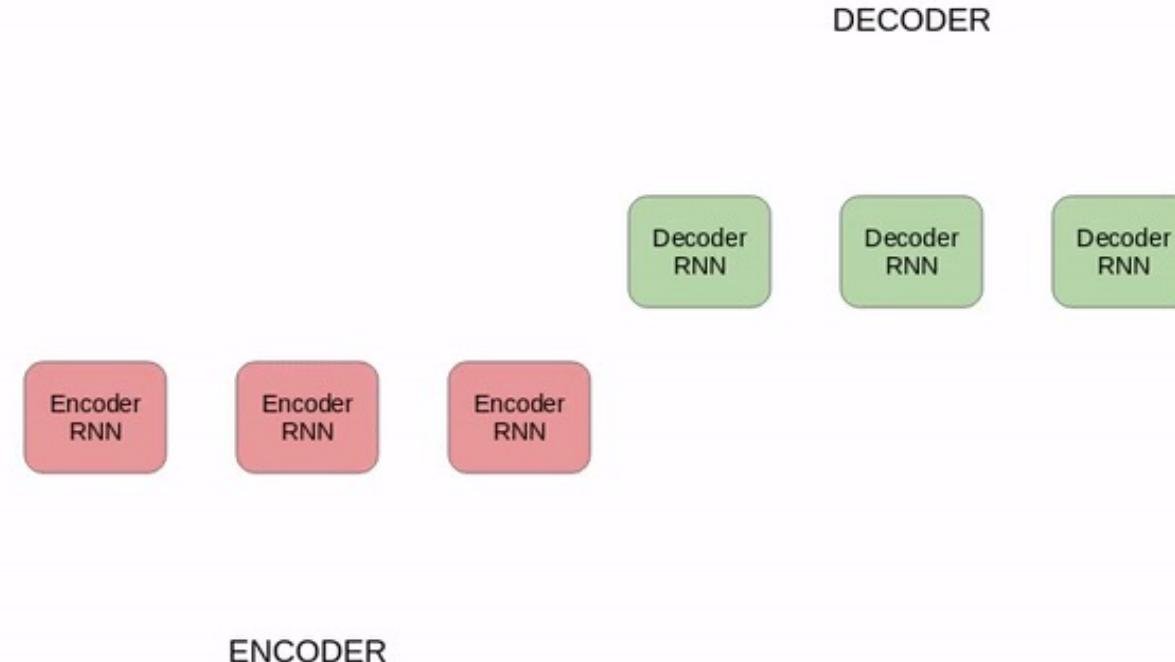

Seq2Seq used for various NLP applications

- Google's Multilingual Neural Machine Translation

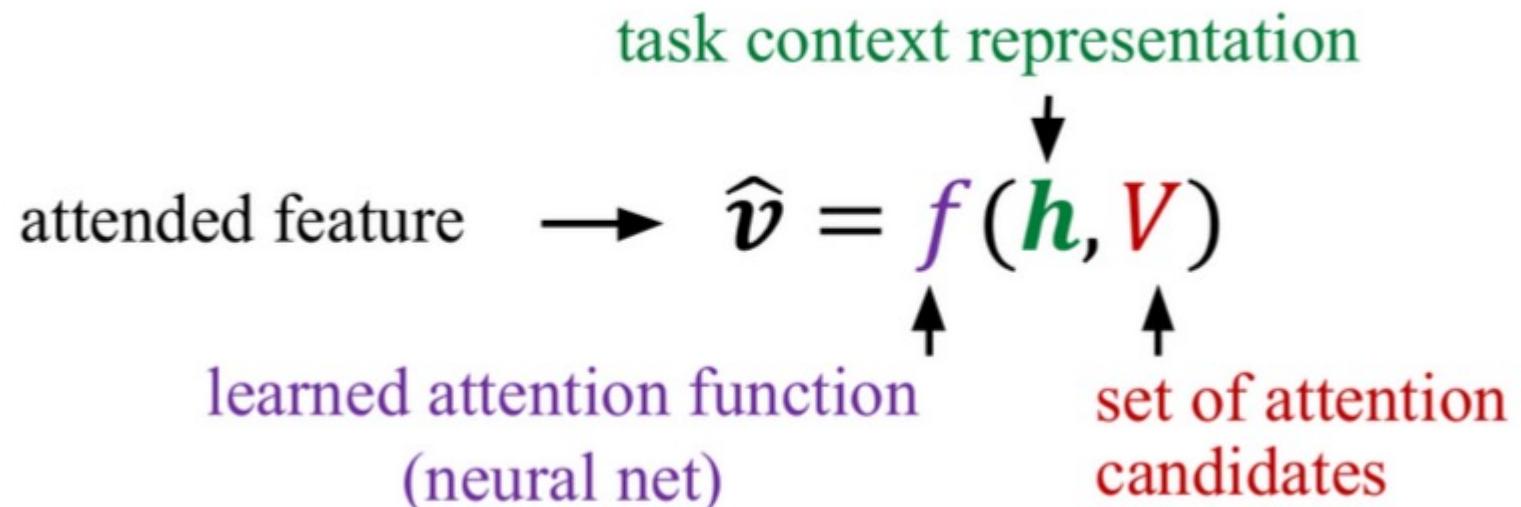

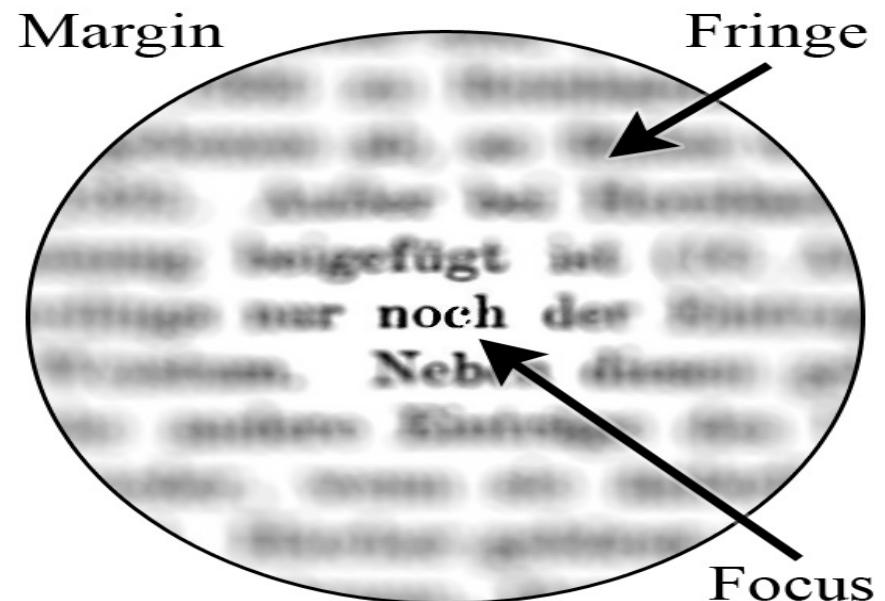

Issues with RNNs for seq2seq tasks

- Despite being very successful for various NLP tasks, there were challenges:
 - dealing with long-range dependencies
 - the sequential nature of the architecture prevents parallelization
- Attention mechanism helped to overcome first issue to certain extent

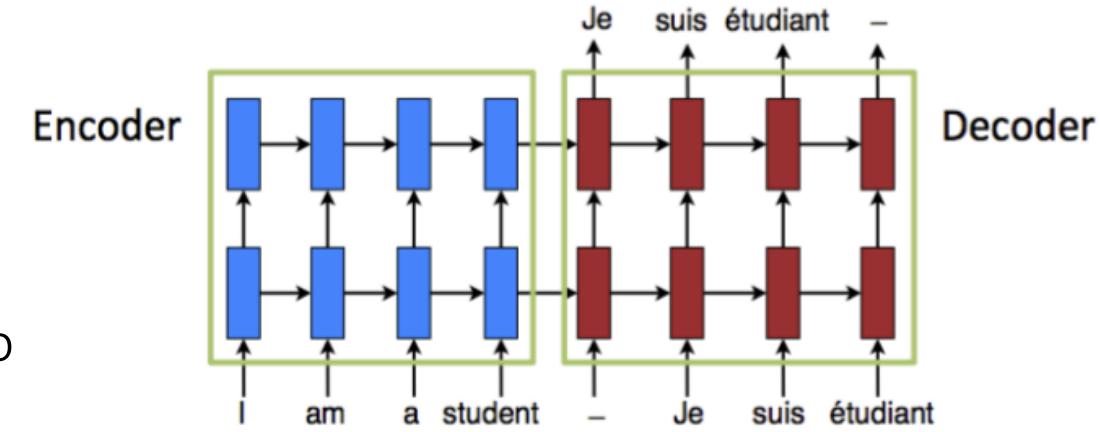

Attention Mechanism

- A set of mechanisms that limit some processing to a subset of incoming stimuli (reducing computational demands)
- Attention in neural networks
 - A mechanism that **learns to focus** on a subset of the **input** that is **relevant to the task**.

Neural Machine Translation by jointly Learning to Align and Translate

- NMT attempts to build and train a single, large neural network that reads a sentence and outputs a correct translation.
- The NMT system is a seq2seq model (Encoder-Decoder framework)
- Issue: The encoder-decoder framework compresses all the necessary information of a source sentence into a fixed-length vector.
- Cho et al. (2014) showed that the performance of a basic encoder-decoder deteriorates as the length of an input sentence increases.
- Bahdanau et al. (2015) proposed an extension to NMT which learns to align and translate jointly.
- The basic idea of “attention” is that at each time the model generates a word in a translation, it searches for a set of positions in a source sentence where the most relevant information is concentrated
- The model predicts a target word based on the context vectors associated with these source positions and all the previous generated target words

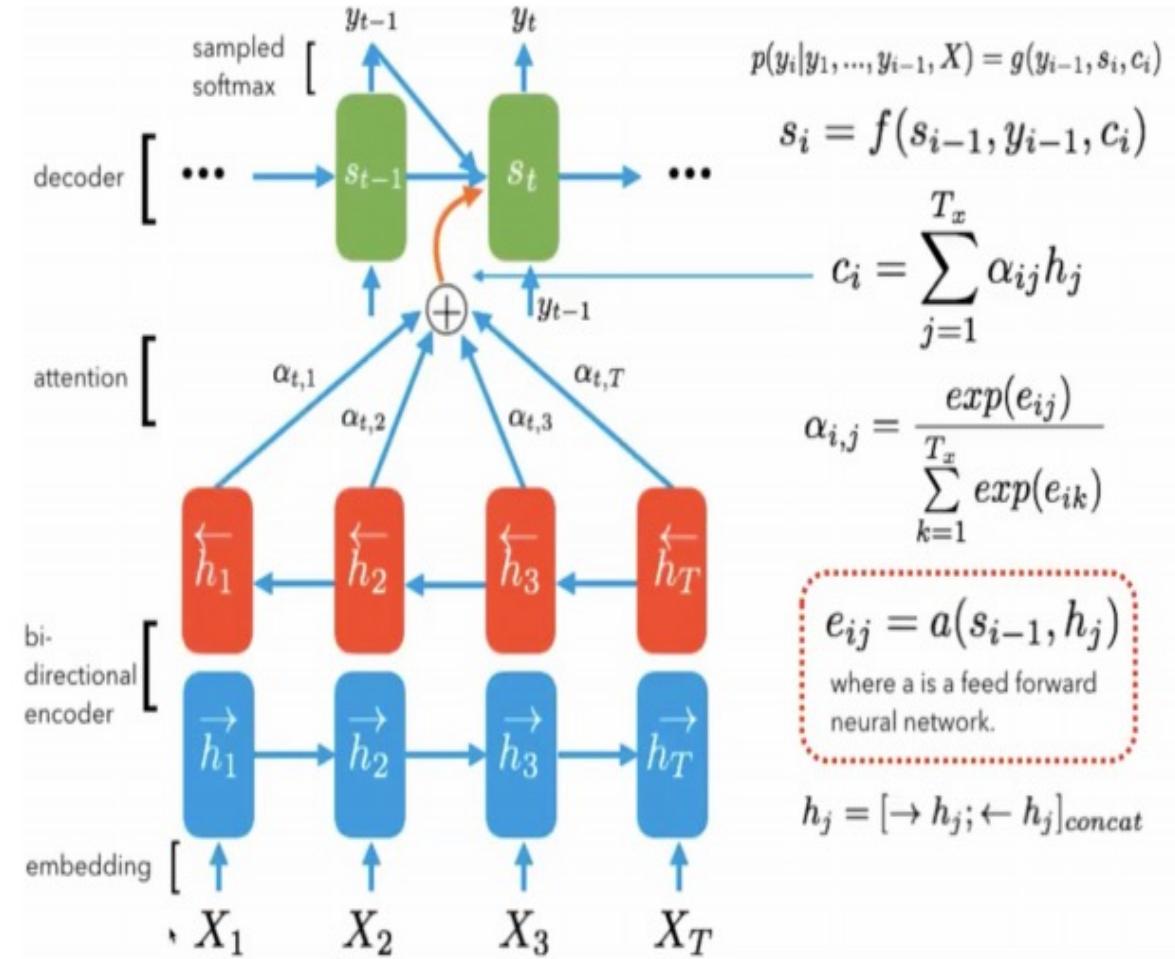

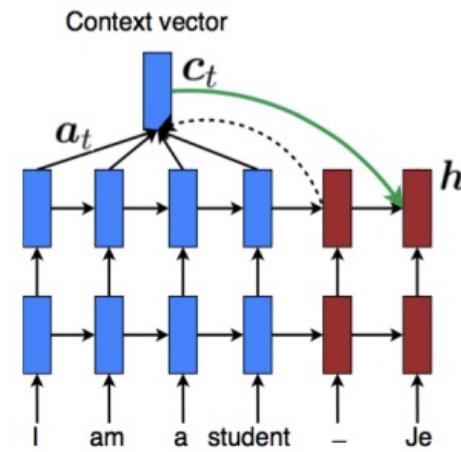

Neural Machine Translation by jointly Learning to Align and Translate

- Solution: Enable the network to pay attention to specific areas of the input by adding new (weighted) connections

$$c_i = \sum_{j=1}^{T_x} \alpha_{ij} h_j$$

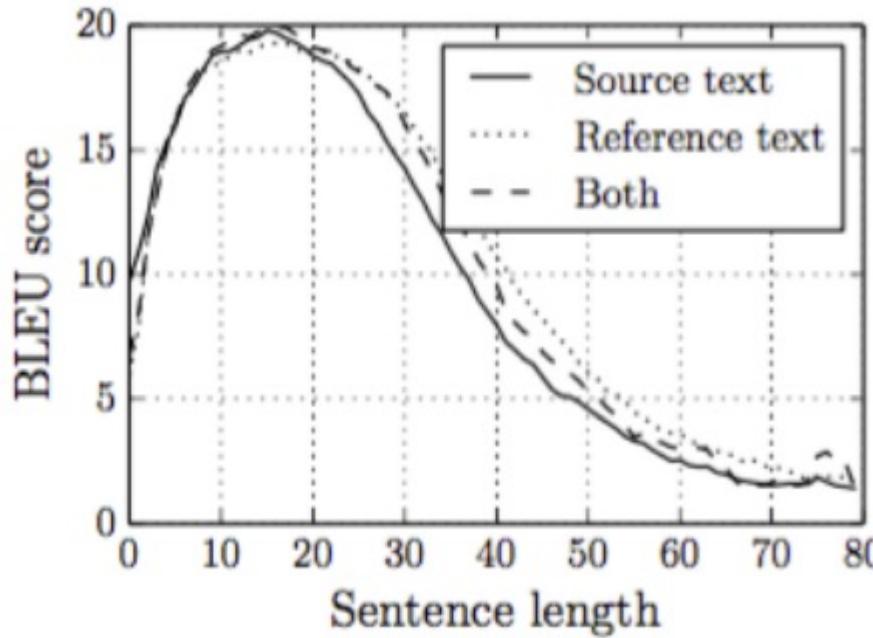

$$\alpha_{ij} = \frac{\exp(e_{ij})}{\sum_{k=1}^{T_x} \exp(e_{ik})},$$

$$e_{ij} = a(s_{i-1}, h_j)$$

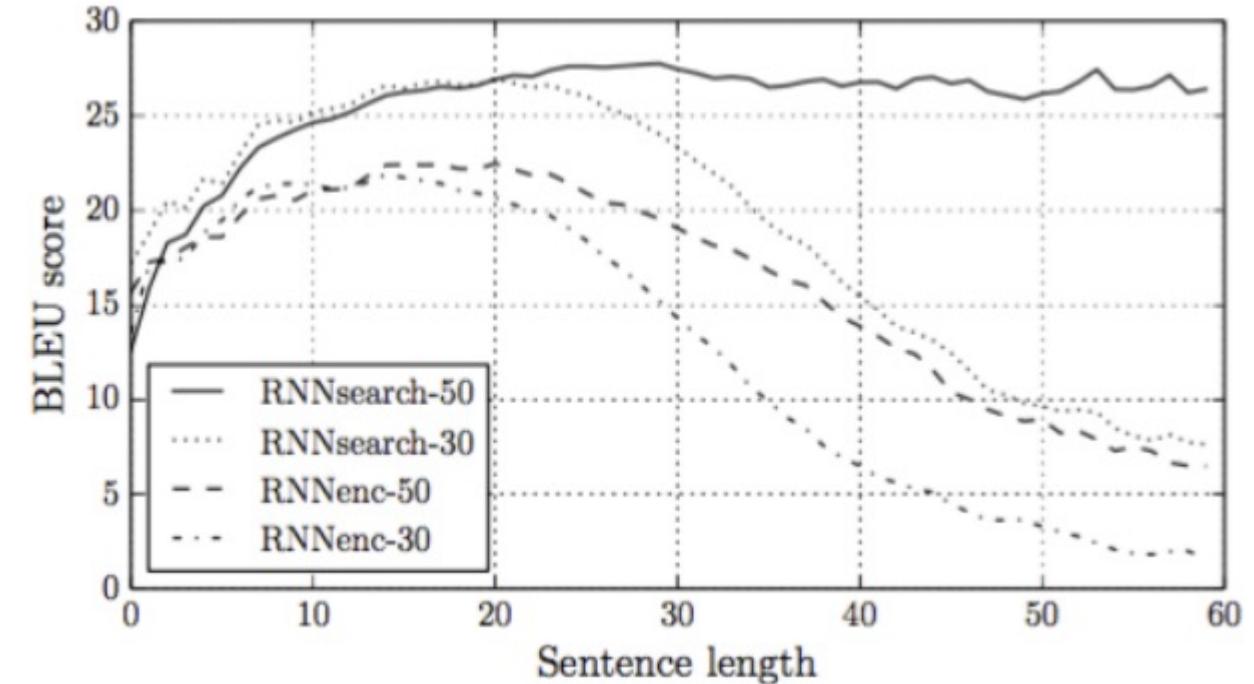

NMT by jointly Learning to Align and Translate

Before Attention: Long sentences are very hard as they are compressed to a fixed length vector

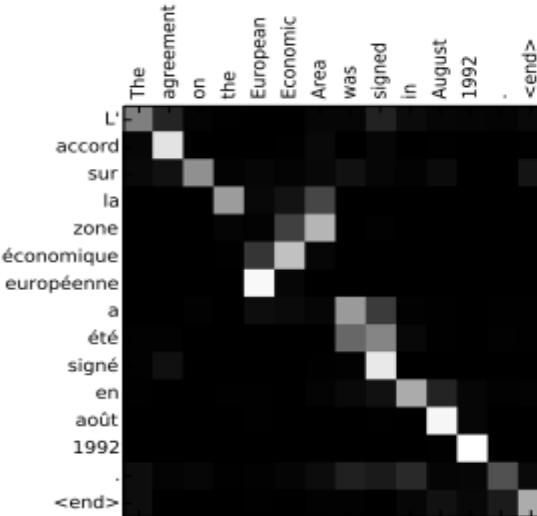

After Attention: The attention mechanism helps to overcome the issue

NMT by jointly Learning to Align and Translate

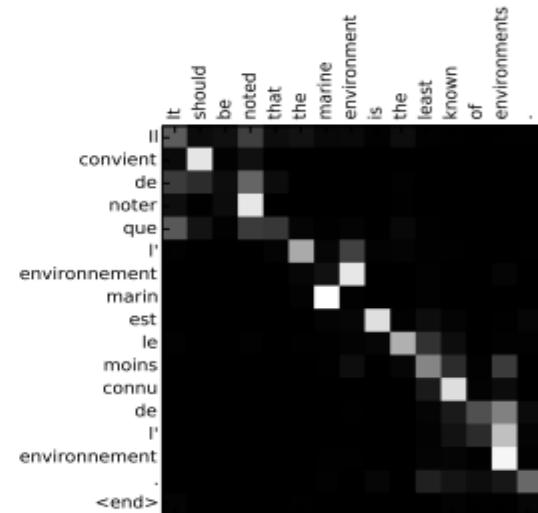

L'accord sur la zone économique européenne a été signé en août 1992.
<end>

This attention matrix visualizes the weights assigned by each word in the source sentence to each word in the target sentence. The matrix is square, with rows and columns labeled by words. The diagonal shows high attention weights (white squares), indicating that each word in the source sentence attends to itself. Off-diagonal elements show lower attention weights, with darker shades of gray indicating lower values.

(a)

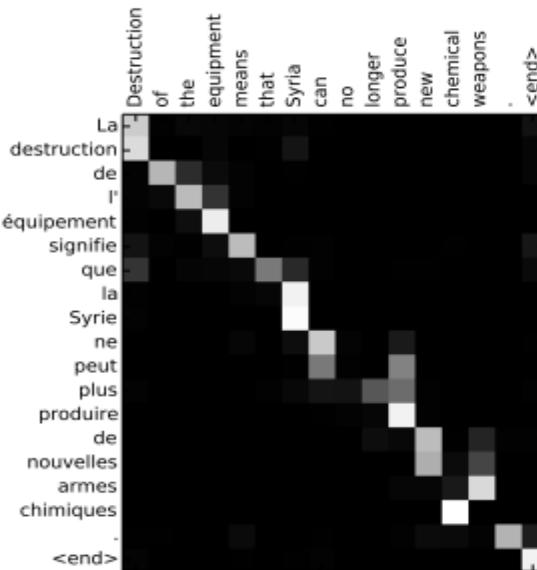

It should be noted that the marine environment is the least known of environments.
<end>

This attention matrix visualizes the weights assigned by each word in the source sentence to each word in the target sentence. The matrix is square, with rows and columns labeled by words. The diagonal shows high attention weights (white squares), indicating that each word in the source sentence attends to itself. Off-diagonal elements show lower attention weights, with darker shades of gray indicating lower values.

(b)

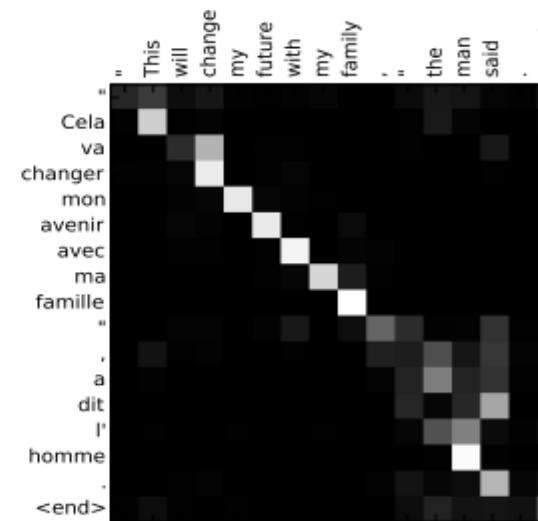

La destruction de l'équipement signifie que la Syrie ne peut plus produire de nouvelles armes chimiques.
<end>

This attention matrix visualizes the weights assigned by each word in the source sentence to each word in the target sentence. The matrix is square, with rows and columns labeled by words. The diagonal shows high attention weights (white squares), indicating that each word in the source sentence attends to itself. Off-diagonal elements show lower attention weights, with darker shades of gray indicating lower values.

(c)

"This will change my future with my family.", "the man said.
<end>

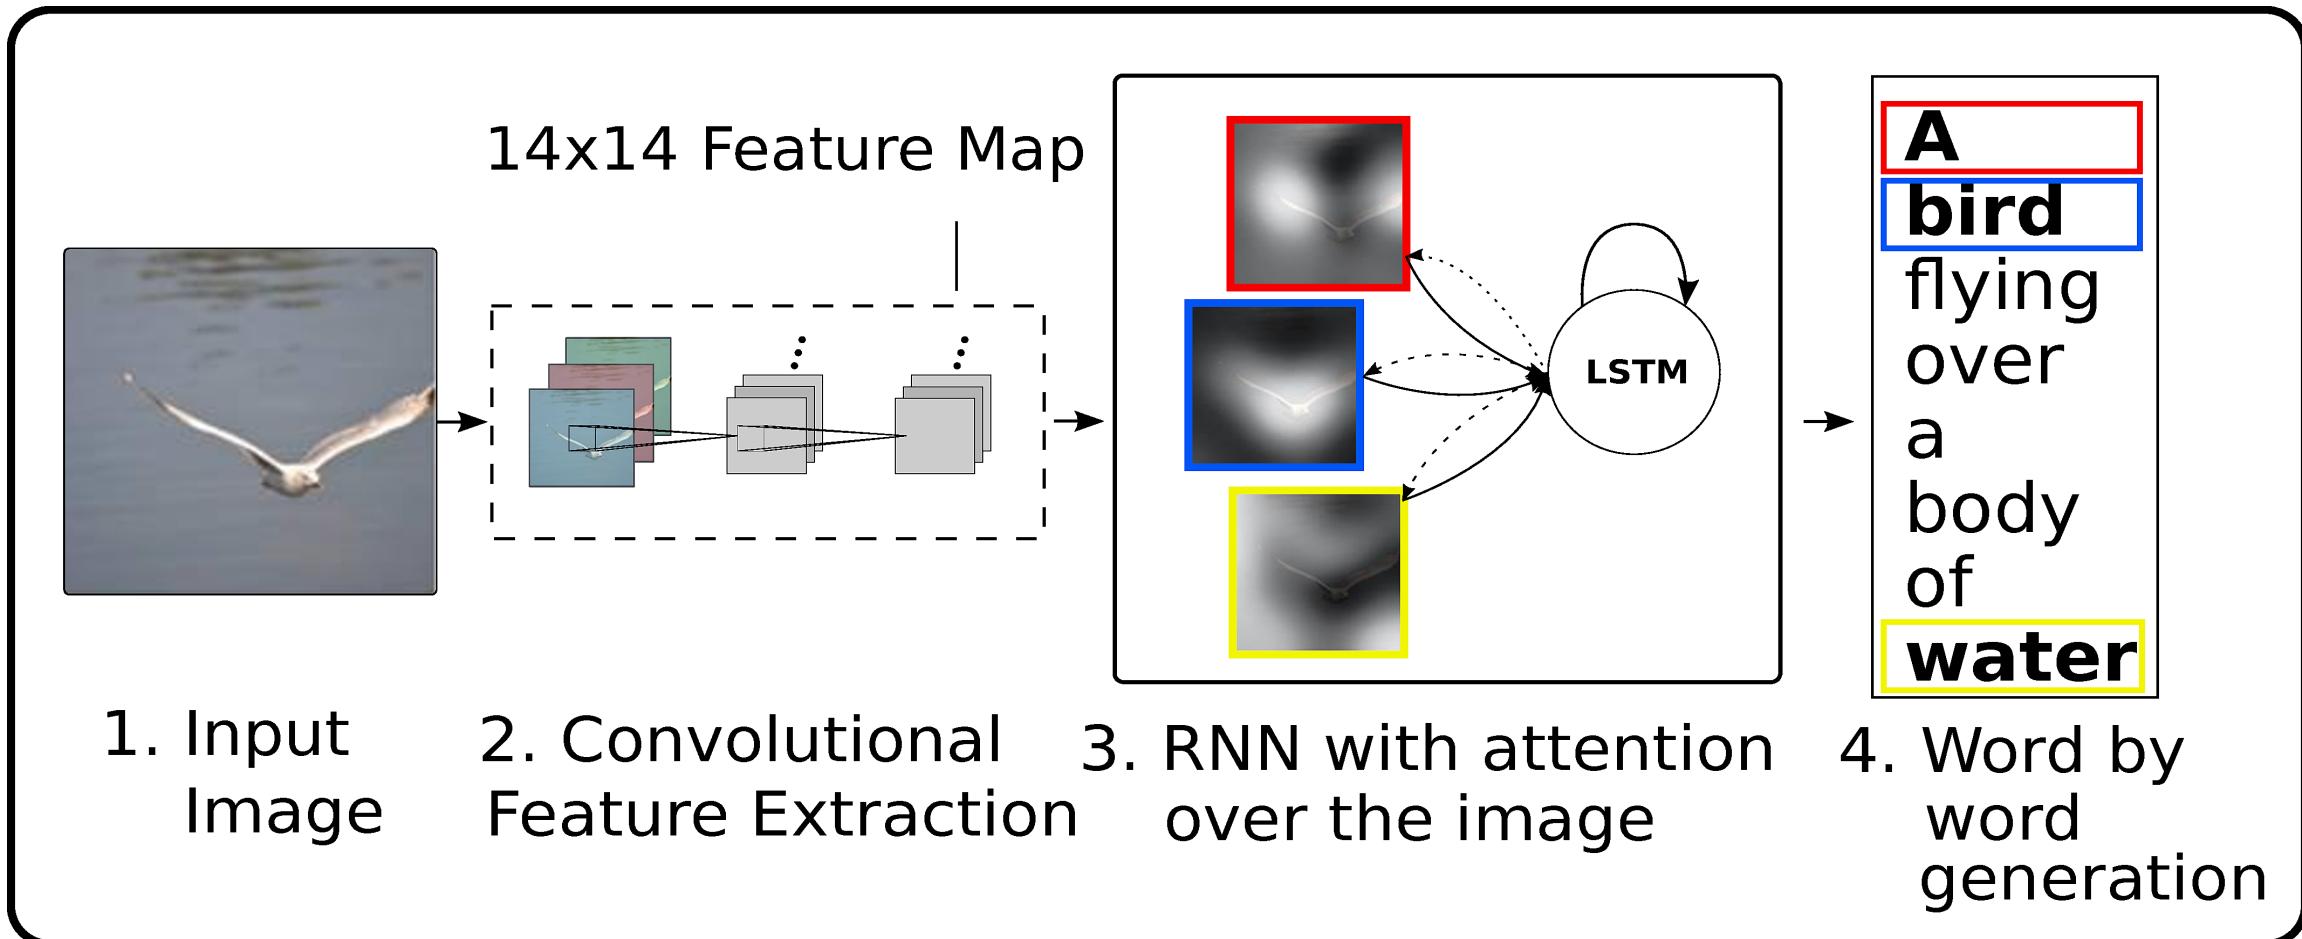

This attention matrix visualizes the weights assigned by each word in the source sentence to each word in the target sentence. The matrix is square, with rows and columns labeled by words. The diagonal shows high attention weights (white squares), indicating that each word in the source sentence attends to itself. Off-diagonal elements show lower attention weights, with darker shades of gray indicating lower values.

(d)

Show, Attend and Tell (Xu et al., 2015)

- “Rather than compressing an entire image into static representation, attention allows for salient features to dynamically come to forefront as needed”

Show, Attend and Tell (Xu et al., 2015)

A woman is throwing a frisbee in a park.

A dog is standing on a hardwood floor.

A stop sign is on a road with a mountain in the background.

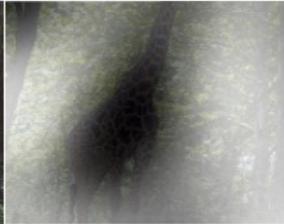

A little girl sitting on a bed with a teddy bear.

A group of people sitting on a boat in the water.

A giraffe standing in a forest with trees in the background.

Transformers

- Attention is All You Need
- Novel architecture relies entirely on **self-attention** to compute representations of its input and output without using sequential RNNs or convolutions.
- Aim is to solve seq2seq tasks while handling long-range dependencies

“Griezmann’s announcement comes as a bit of a shock. After enduring the drama surrounding his potential last summer, many thought he was committed to Atletico for more than a year, but the Frenchman seems to have changed his mind.”

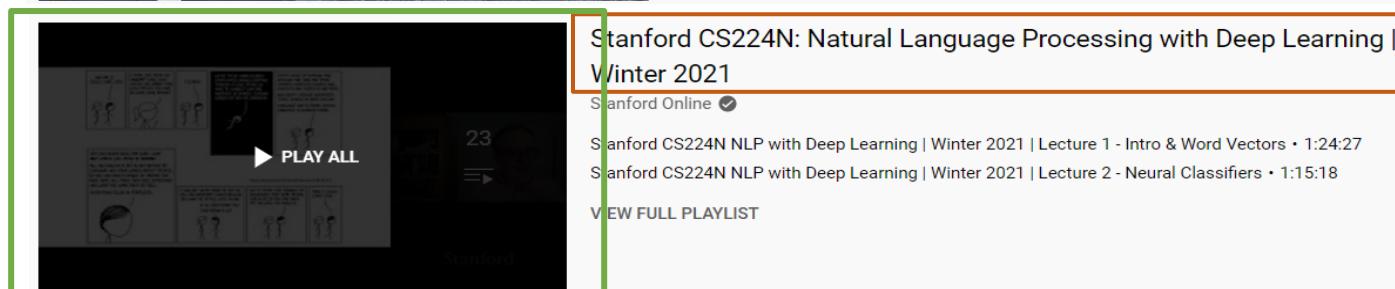

Self-attention in transformers

➤ Understanding self-attention with Search

- Query (Q)
- Key (K)
- Value (V)

Value (V)

Query (Q)

Key 1 (K1)

Key 2 (K2)

Key 3 (K3)

Self-attention in transformers

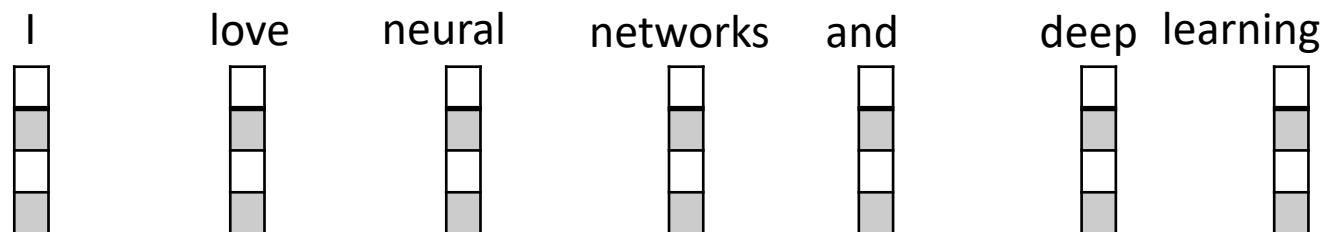

Self-attention:

Identify and attend to most important features in input

Step 1: Encode position information

Embeddings

Self-attention:

Step 1: Encode position information

Step 2: Extract query (Q), key (K), and value (V)

Step 3: Compute attention weighting

Step 4: Extract features with high attention

BERT

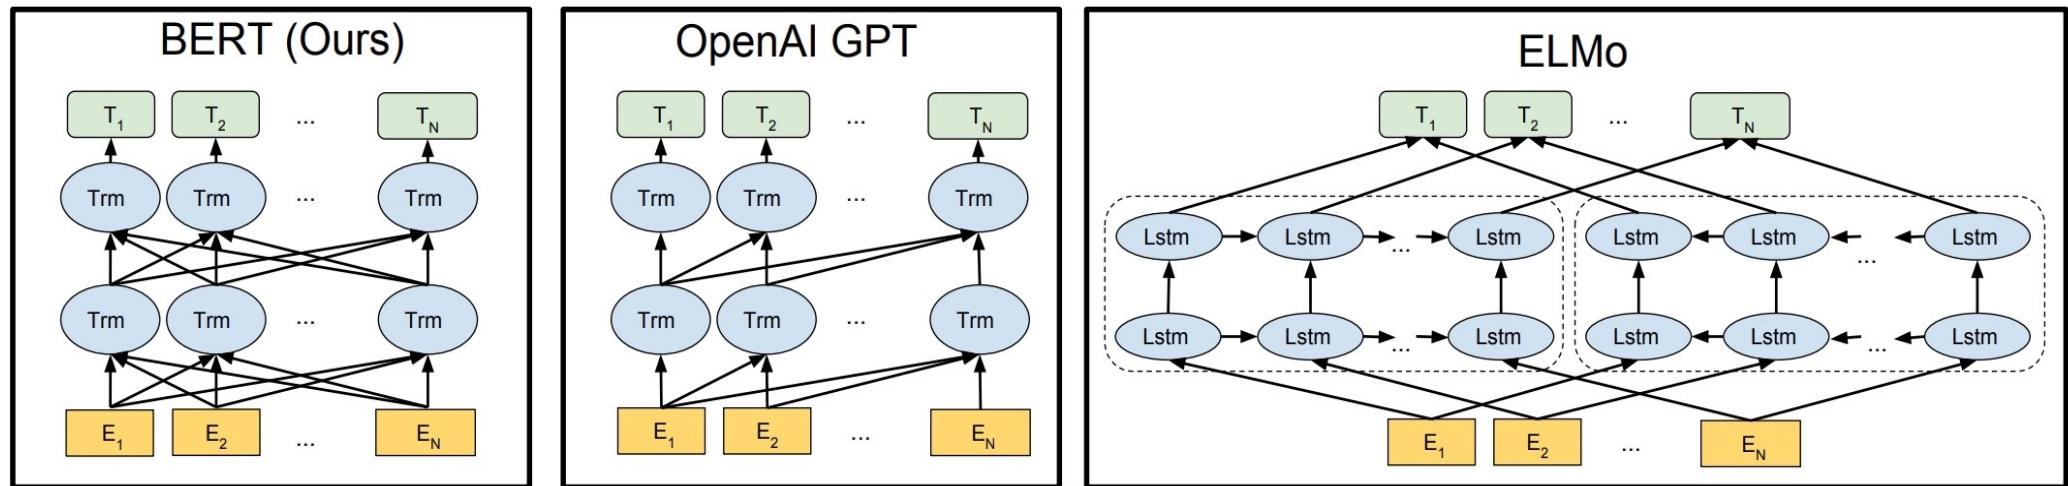

- Bidirectional Encoder Representations from Transformers
- Idea to have **deeply bidirectional, unsupervised language representation**
- Example sentence: “I accessed the bank account”
 - Unidirectional contextual model would represent “bank” based on “I accessed the”
 - BERT represent “bank” based on both its previous and next context – “I accessed the --- account”
- Why bidirectional in BERT possible?
 - Not possible to train bidirectional models by simply conditioning each word on its previous and next words, since this would allow the word that's being predicted to indirectly “see itself” in a multi-layer model.
 - BERT rely on two tasks
 - Masking words in the input
 - Next sentence prediction

Input: The man went to the [MASK]₁ . He bought a [MASK]₂ of milk .
Labels: [MASK]₁ = store; [MASK]₂ = gallon

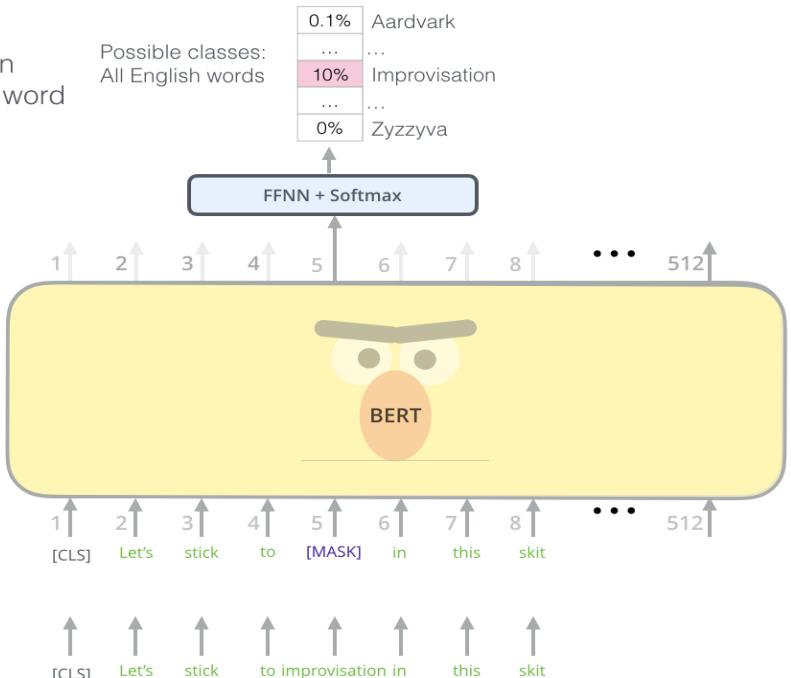

Sentence A = The man went to the store.
Sentence B = He bought a gallon of milk.
Label = IsNextSentence

Sentence A = The man went to the store.
Sentence B = Penguins are flightless.
Label = NotNextSentence

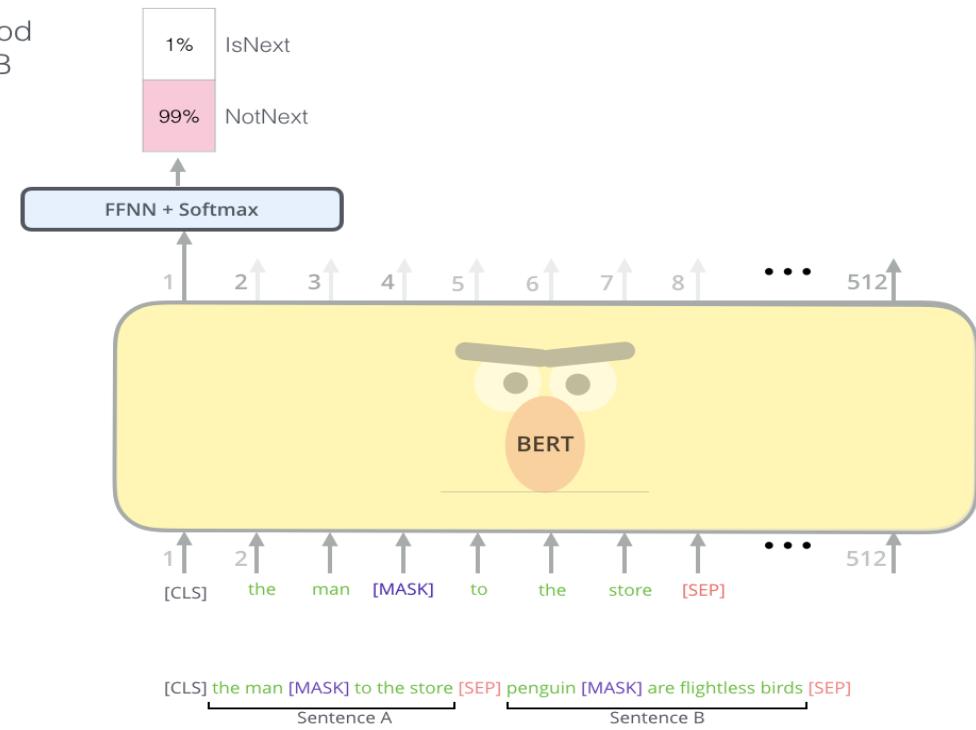

BERT

Use the output of the masked word's position to predict the masked word

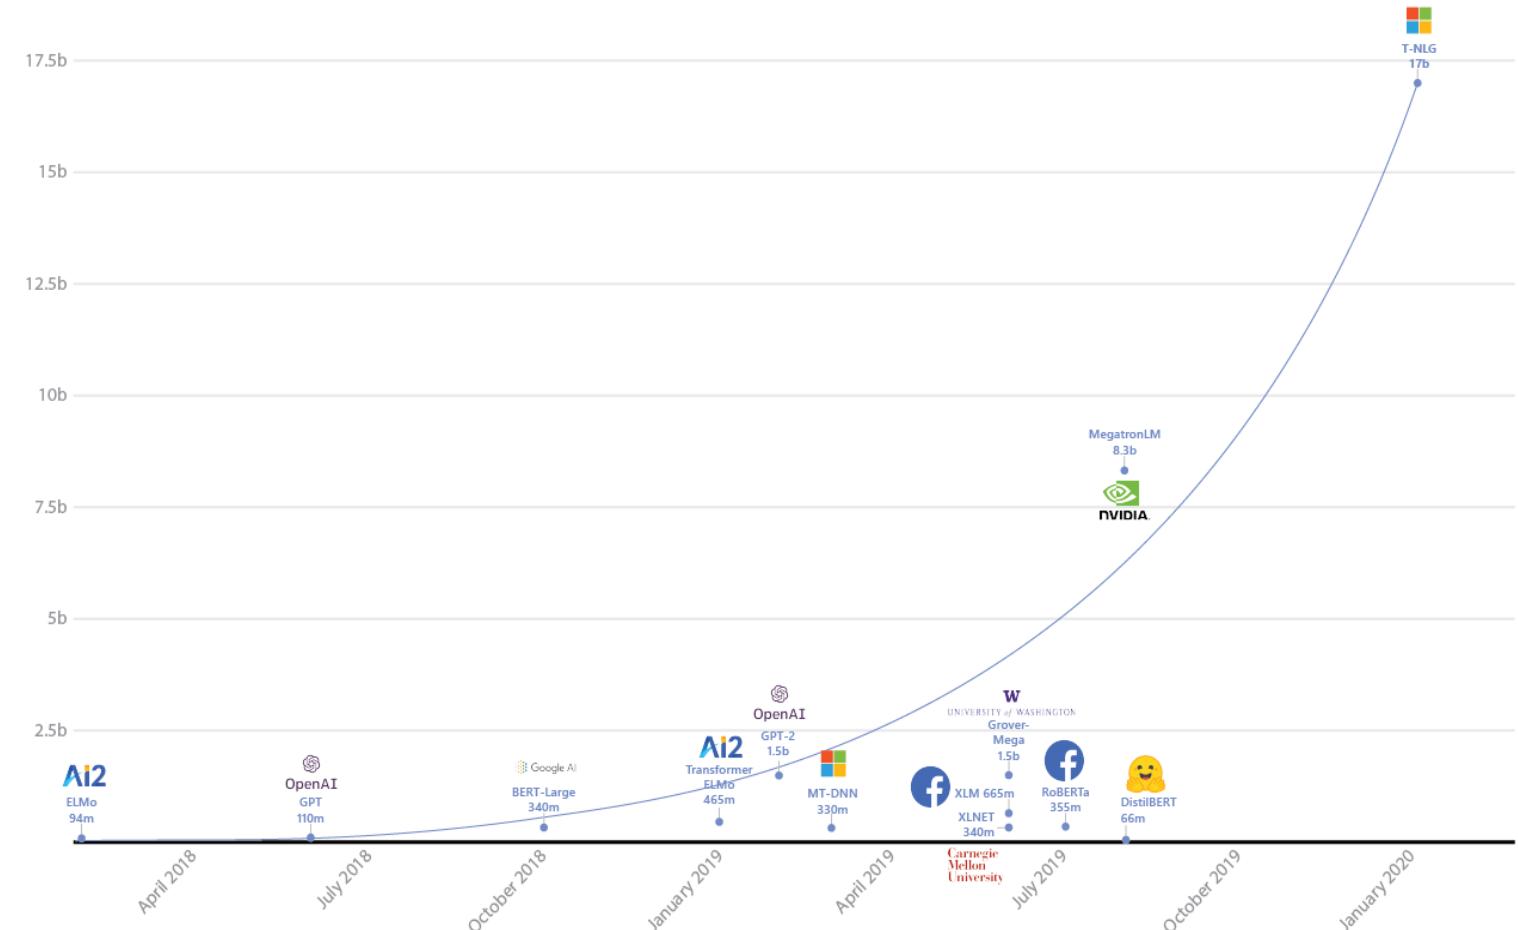

Predict likelihood that sentence B belongs after sentence A

Turing-NLG

- A Transformer based generative language model
- Based on DeepSpeed (DL library) to make distributed training of large models easier
- 17 billion parameters

OpenAI GPT-3

- Key idea: Improve task-agnostic few-shot performance
- Evaluation on various NLP tasks under few-shot learning, one-shot learning, and zero-shot learning demonstrates GPT-3 promising results
- Technical details:
 - An autoregressive language model
 - GPT-3 has 96 layers with each layer having 96 attention heads
 - trained on datasets with 500 billion tokens
 - Word embedding size of 12888
 - Context window size is of 2048 tokens
 - Uses alternating dense and locally banded sparse attention patterns
- Compute:
 - Trained on more than 576 GB of text data including common crawl, Books, and Wikipedia
 - About 175 billion parameters
 - costs OpenAI around \$4.6 million

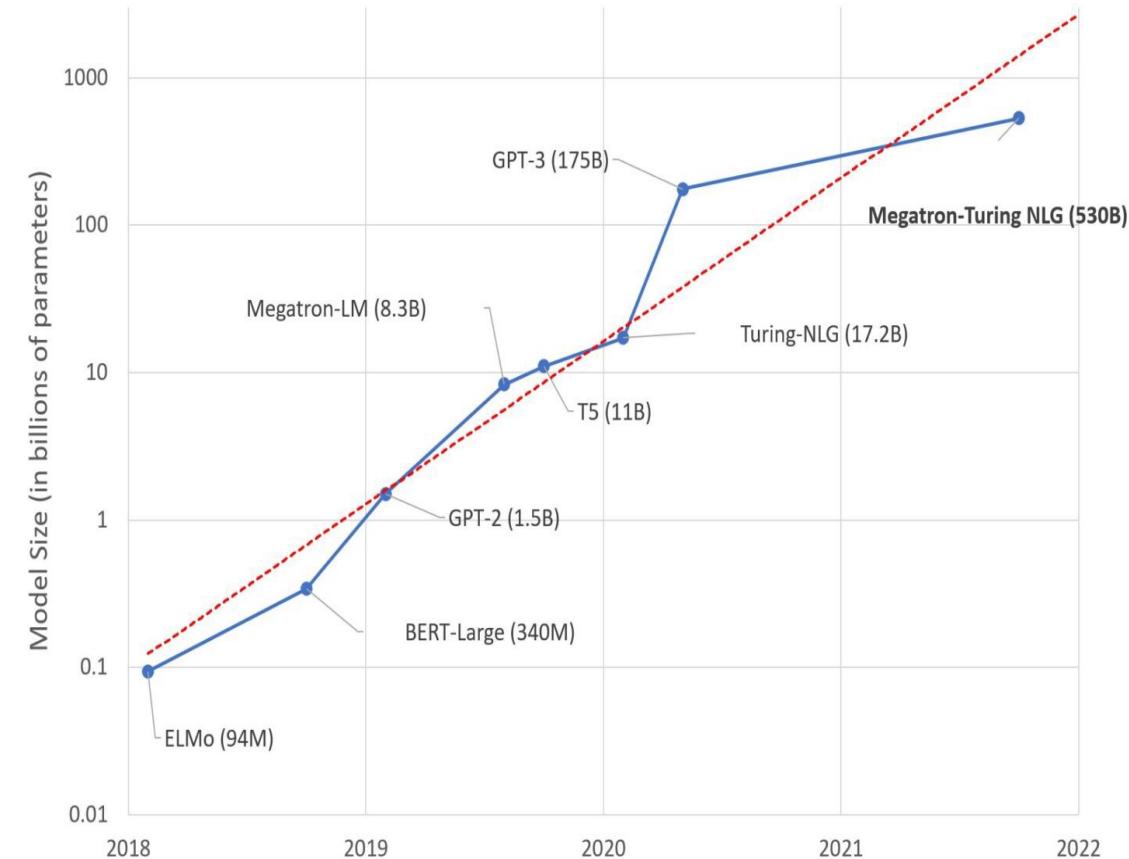

Behold the Megatron: Microsoft and Nvidia build massive language processor

MT-NLG is a beast that fed on over 4,000 GPUs

Katyanna Quach

Tue 12 Oct 2021 // 00:36 UTC

- Largest transformer model to date
- 530 billion parameters
- Trained on a wide variety of NLP tasks such as auto-completing sentences, question and answering, reading and reasoning
- Outperforms various tasks with little to no fine-tuning, in a few-shot or zero-shot learning
- Trained using Nvidia's Selene machine learning supercomputer
- Estimated to cost \$85 million

Where is the journey heading?

- Are bigger language models better?
 - Bigger models are better at generalizing on various downstream tasks
 - Issues: Bias, carbon footprints

ARTICLE OPEN ACCESS

On the Dangers of Stochastic Parrots: Can Language Models Be Too Big?

Authors:  Emily M. Bender,  Timnit Gebru,  Angelina McMillan-Major,  Shmargaret Shmitchell [Authors Info & Claims](#)

FAccT '21: Proceedings of the 2021 ACM Conference on Fairness, Accountability, and Transparency • March 2021 • Pages 610–623 • <https://doi.org/10.1145/3442188.3445922>

Published: 03 March 2021

Yann LeCun

27 October 2020 at 13:01 · 

“It’s entertaining, and perhaps mildly useful as a creative help,” LeCun wrote.

“But trying to build intelligent machines by scaling up language models is like building high-altitude airplanes to go to the moon. You might beat altitude records, but going to the moon will require a completely different approach.”

Large computer language models carry environmental, social risks

It takes an enormous amount of computing power to fuel the model language programs, Bender said. That takes up energy at tremendous scale, and that, the authors argue, causes environmental degradation. And those costs aren’t borne by the computer engineers, but rather by marginalized people who cannot afford the environmental costs.

Another risk comes from the training data itself, the authors say. Because the computers read language from the Web and from other sources, they can pick up and perpetuate racist, sexist, ableist, extremist and other harmful ideologies.

Where is the journey heading?

Deep Learning, Deep Pockets?

As you would expect, training a 530-billion parameter model on humongous text datasets requires a fair bit of infrastructure. In fact, Microsoft and NVIDIA used hundreds of DGX A100 multi-GPU servers. At \$199,000 a piece, and factoring in networking equipment, hosting costs, etc., anyone looking to replicate this experiment would have to spend close to \$100 million dollars. Want fries with that?

Summary

- Large language modeling is like race between titans
- Large language model size is increasing 10x every year for the last few years. Moore's Law
- Issues:
 - Environmental cost (carbon footprint)
 - Hard to replicate
 - Very complex
- The need:
 - To build practical and efficient solutions
 - Within everyone's capability and reach to solve real-world problems
