## RLFM Index (No LF mapping)

## RLFM Index (No LF mapping)

```
0 g c g 3 1
5 0 (t (t
```

Now we have B, S, **B'**Let's **reverse** (decode) using LF mapping

#### **CHANGES TO FORMULAS**

- Recall that we need to compute
   C<sub>T</sub>[c]+rank<sub>c</sub>(L.i) in the backward search.
- Theorem: C[c]+rank<sub>c</sub>(L,i) is equivalent to select<sub>1</sub>(B',C<sub>S</sub>[c]+1+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))-1, when L[i]≠ c (e.g., when backward search), and otherwise (e.g., when reverse, sometimes backward search too) to select<sub>1</sub>(B',C<sub>S</sub>[c]+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))+ i-select<sub>1</sub>(B,rank<sub>1</sub>(B,i)).

You can apply these formulas to do reversing & backward search.

### **CHANGES TO FORMULAS**

- Recall that we need to compute
   C<sub>T</sub>[c]+rank<sub>c</sub>(L.i) in the backward search.
- Theorem: C[c]+rank<sub>c</sub>(L,i) is equivalent to select<sub>1</sub>(B',C<sub>S</sub>[c]+1+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))-1, when L[i]≠ c (e.g., when backward search), and otherwise (e.g., when reverse, sometimes backward search too) to select<sub>1</sub>(B',C<sub>S</sub>[c]+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))+ i-select<sub>1</sub>(B,rank<sub>1</sub>(B,i)).

But I promised that I would explain why/how these formulas actually work

```
C
                               g
10
```

Suppose reverse from L[8]

```
g c g 3 1
rank_a(S, rank_1(B, 8))
= 2
```

```
g
rank_a(S, rank_1(B, 8))
= 2
```

```
g
```

 $select_1(B', C_s[a] + rank_a(S, rank_1(B, 8)))$ 

```
C
                               g 3
                         g
                      0
10
```

 $select_1(B', C_s[a] + rank_a(S, rank_1(B, 8))) = 3$ 

Good, but not good enough

```
0
  g c g 3 1
```

select<sub>1</sub>(B', C<sub>s</sub>[c]+rank<sub>c</sub>(S, rank<sub>1</sub>(B, 3))) =select<sub>1</sub>(B', 2 + 1)=4

```
0
                                      g
                               g
10
```

select<sub>1</sub>(B', C<sub>s</sub>[c]+rank<sub>c</sub>(S, rank<sub>1</sub>(B, 3))) =select<sub>1</sub>(B', 2 + 1)= $\frac{4}{2}$ 

```
g 3
                          g
10
```

select<sub>1</sub>(B', C<sub>s</sub>[c]+rank<sub>c</sub>(S, rank<sub>1</sub>(B, 3))) =select<sub>1</sub>(B', 2 + 1)=4 + 2

```
g
                       g
10
```

select<sub>1</sub>(B', C<sub>s</sub>[c]+rank<sub>c</sub>(S, rank<sub>1</sub>(B, 3))) =select<sub>1</sub>(B', 2 + 1)=4 + (i -rank<sub>1</sub>(B, i))

Another example, LF[5] = ?

```
g c g 3 1
0
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -rank<sub>1</sub>(B, i))
```

```
0
  g c g 3
0
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -rank<sub>1</sub>(B, i))
```

```
g c g 3
0
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -rank<sub>1</sub>(B, i))
```

```
g c g 3 1
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -select<sub>1</sub>(B, rank<sub>1</sub>(B, i))) 50
```

```
g c g 3 1
0
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -select<sub>1</sub>(B, rank<sub>1</sub>(B, i))) <sub>1</sub> + 5 - 4
```

```
<u>B'</u>
                         0
                                 c g 3
                         0
                             g
       a t 8
10
```

```
select<sub>1</sub>(B', C<sub>s</sub>[a]+rank<sub>a</sub>(S, rank<sub>1</sub>(B, 5)))
=select<sub>1</sub>(B', 0 + 1)=1 + (i -select<sub>1</sub>(B, rank<sub>1</sub>(B, i))) 58
+ 5 - 4
```

### **CHANGES TO FORMULAS**

- Recall that we need to compute
   C<sub>T</sub>[c]+rank<sub>c</sub>(L.i) in the backward search.
- Theorem: C[c]+rank<sub>c</sub>(L,i) is equivalent to select<sub>1</sub>(B',C<sub>S</sub>[c]+1+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))-1, when L[i]≠ c (e.g., when backward search), and otherwise (e.g., when reverse, sometimes backward search too) to select<sub>1</sub>(B',C<sub>S</sub>[c]+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))+ i-select<sub>1</sub>(B,rank<sub>1</sub>(B,i)).

```
select_1(B', \overline{C_s[a]} + rank_a(S, rank_1(B, 5)))
= select_1(B', 0 + 1) = 1 + (i - select_1(B, rank_1(B, i)))
```

### Therefore ...

### **CHANGES TO FORMULAS**

- Recall that we need to compute
   C<sub>T</sub>[c]+rank<sub>c</sub>(L.i) in the backward search.
- Theorem: C[c]+rank<sub>c</sub>(L,i) is equivalent to select<sub>1</sub>(B',C<sub>S</sub>[c]+1+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))-1, when L[i]≠ c (e.g., when backward search), and otherwise (e.g., when reverse, sometimes backward search too) to select<sub>1</sub>(B',C<sub>S</sub>[c]+rank<sub>c</sub>(S,rank<sub>1</sub>(B,i)))+ i-select<sub>1</sub>(B,rank<sub>1</sub>(B,i)).
